This work is of fundamental importance to the student who wishes to learn the nature of the biological changes going on in milk and its products, whether he is concerned purely with the practical side of dairying or is interested in the cognate work of dairy chemistry or dairy bacteriology. The attempt has been made to keep the scope of this work within the realm of dairy bacteriology, and not encroach upon the field of dairy manufactures. For example, in the study of starters it is desirable that the bacteriological student should know how to determine the purity and vigor of a culture, but the practical propagation of the starter should be presented from the creamery point of view. The effect of the ripening of cream on the churning process and the action of acid on the physical condition of cheese are instances of biologic activity that can better be studied in the factory than in the laboratory. In many cases it would be advantageous if the practical and theoretical work could be carried on simultaneously. Thus, in studying a starter bacteriologically it would be very desirable to test in the laboratory by frequent examinations the purity of the starter as it is handled in the dairy from day to day.
