The experiment was laid down in split plot design with three replications, keeping plant density as main plot factor and bulb size as sub plot factor. The effects were studied by collecting data on bulb sprouting and plant performance, yield components, seed yield and seed quality parameters. Analyses of variance, mean comparison using least significant difference, correlation analysis were made using SAS computer software. Plant density significantly influenced bulb sprouting, umbel size, seed yield per 100m<sup>2</sup> and germination percentage. The largest umbel size (4.9cm) was obtained from low plant density; whereas the smallest (4.4cm) from high plant density. Maximum seed yield per 100m<sup>2</sup> (1,163,446 seeds) was collected from high density while low density yielded only 416,240 seeds per...
